# C Programming Assignment – Question 8

## 8. Employee Job Level

### Question

A company has Junior, Mid-Level, and Senior job levels. Employees with more than 7 years of experience can be Senior if performance is at least 85. Employees with 3–7 years can be Mid-Level if performance is at least 80. Employees with less experience cannot be Senior.

### Sample Input

```
Experience: 9
Performance: 88
```

### Sample Output

```
Level: Senior
```

### C Program

```
#include <stdio.h>

int main(void) {
    int experience, performance;

    printf("Enter years of experience: ");
    scanf("%d", &experience);

    printf("Enter performance score: ");
    scanf("%d", &performance);

    if (experience > 7 && performance >= 85) {
        printf("Level: Senior\n");
    } else if (experience >= 3 && experience <= 7 &&
               performance >= 80) {
        printf("Level: Mid-Level\n");
    } else {
        printf("Level: Junior\n");
    }

    return 0;
}
```

### Explanation

1. Read experience and performance score.

2. Assign Senior if experience is greater than 7 and performance is at least 85.

3. Otherwise, assign Mid-Level if experience is 3–7 and performance is at least 80.

4. For other combinations, assign Junior under this interpretation.

### Note

The sample gives experience 9 and performance 88, so the output is Level: Senior. The statement does not fully specify all other combinations.
